Deploy SQL Server Database to MonsterASP.NET

Step 1: Take a Backup of Your Existing SQL Server Database

Open **SQL Server Management Studio (SSMS)**.

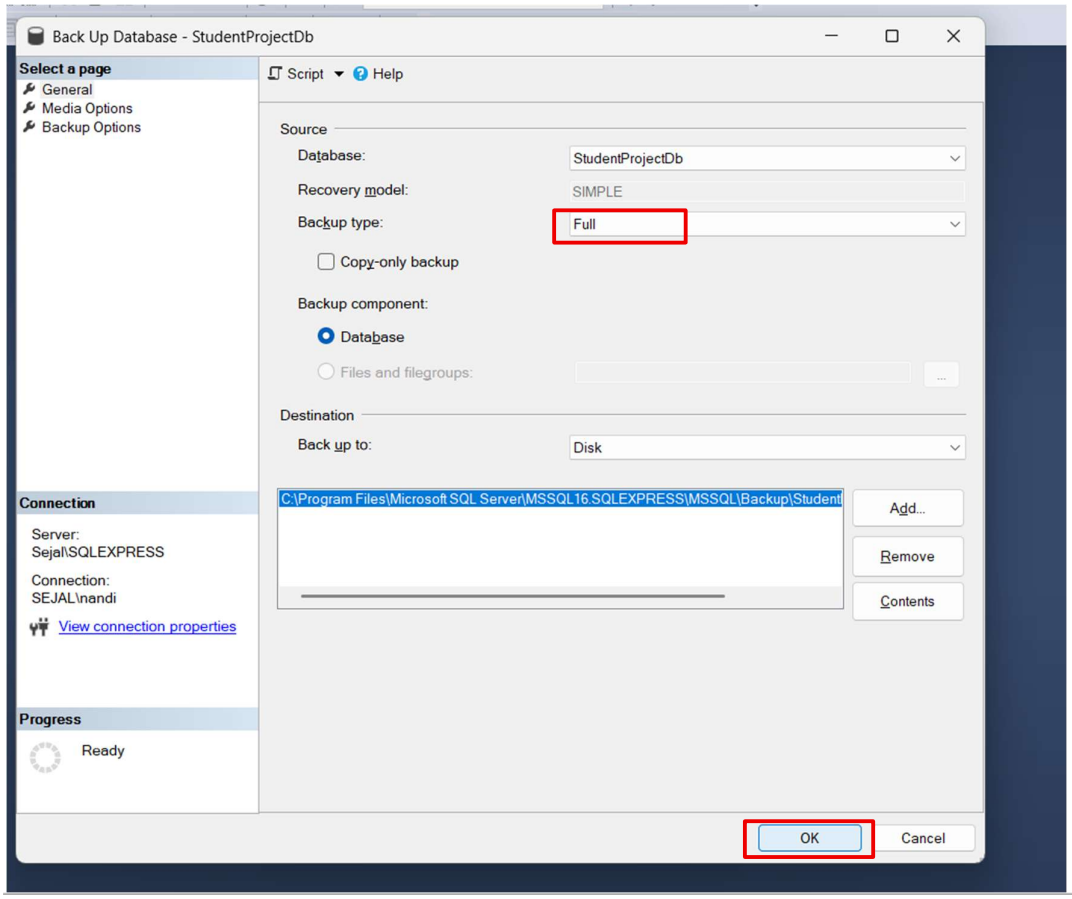

1. Open SSMS and connect to your local SQL Server.
2. Find the database that you want to host on MonsterASP.NET.
3. Right-click on the database.
4. Select:

Tasks → Back Up...

1. In the **Back Up Database** window:
    - **Backup type:** Select `Full`
    - Under **Destination**, select a location where you want to save the backup.

2. Make sure the backup file has the `.bak` extension.
3. Click **OK**.

Step 2: Verify the `.bak` File

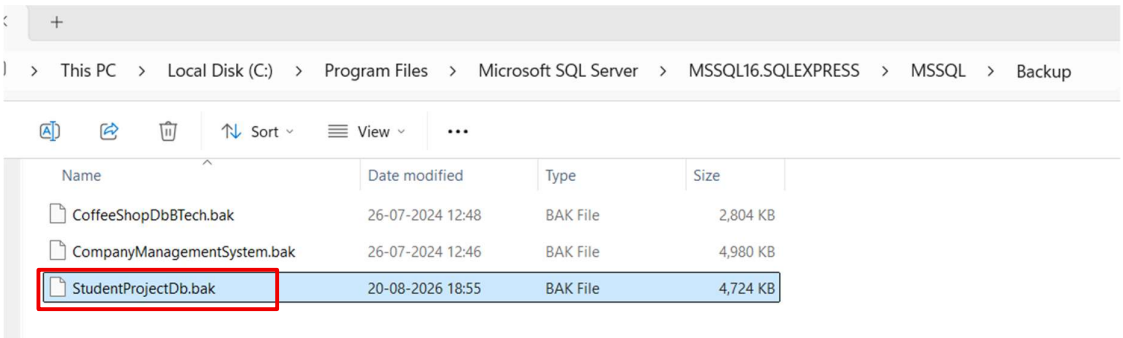

Go to the folder where you saved the backup.

For example:

```
C:\Program Files\Microsoft SQL
Server\MSSQL16.SQLEXPRESS\MSSQL\Backup\StudentProjectDb.bak
```

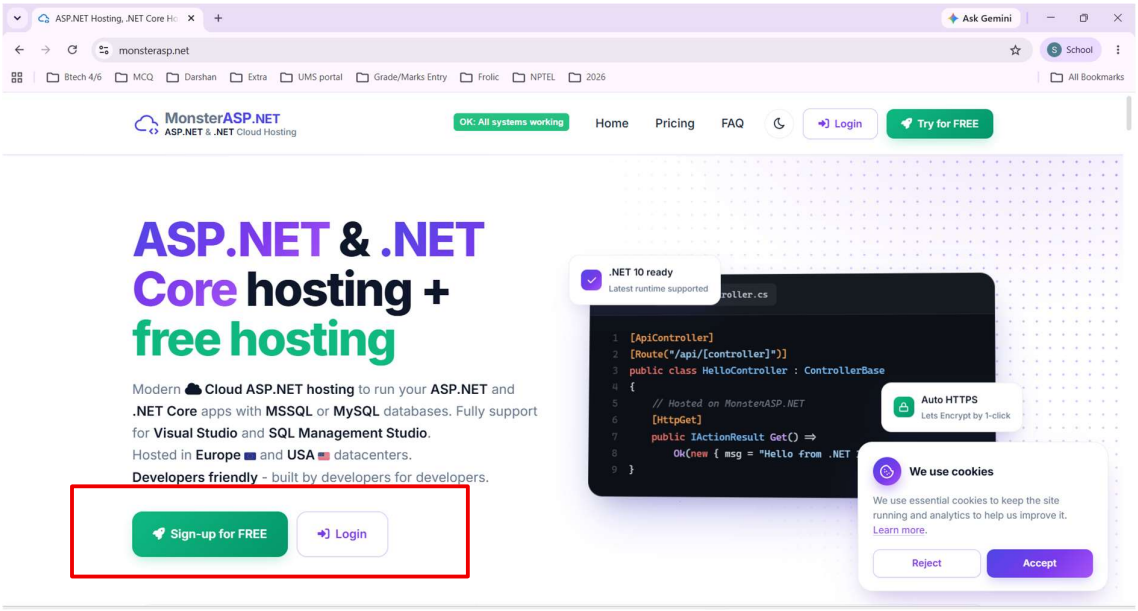

Make sure the `.bak` file has actually been created.

You will need this file in the next steps.

Step 3: Open MonsterASP.NET

Open the MonsterASP.NET: https://www.monsterasp.net/

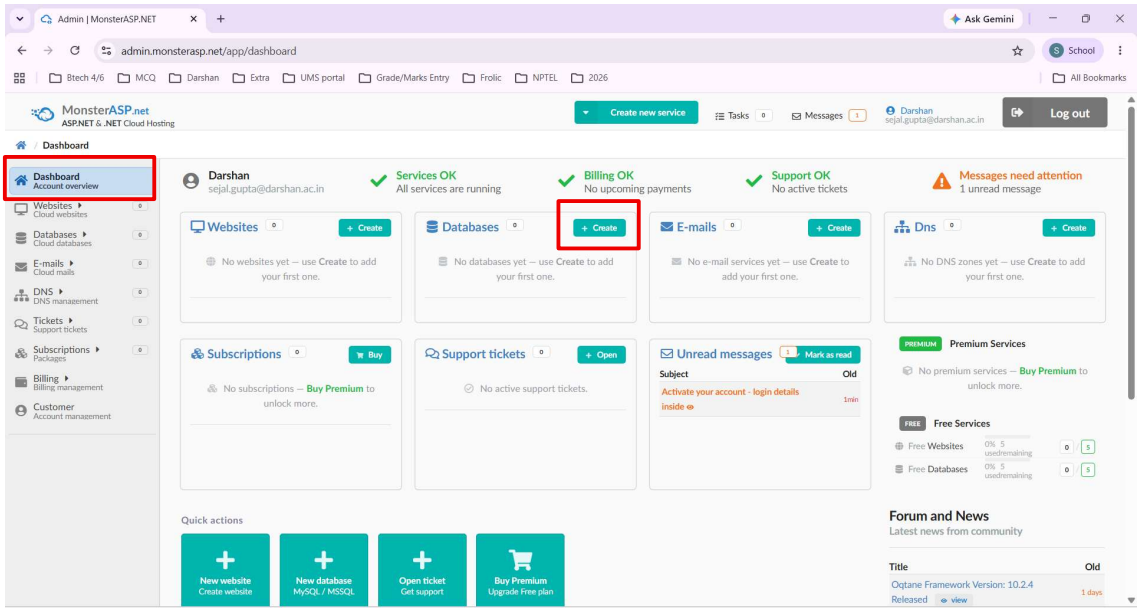

1. Create an account or sign in to your existing account.
2. Open the **Dashboard** section.

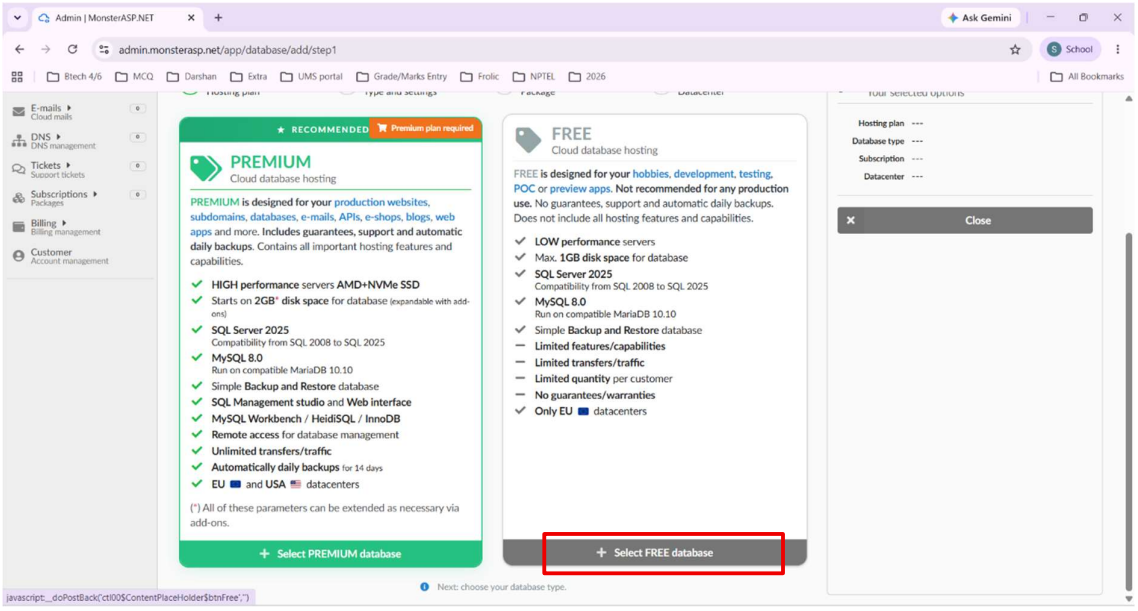

Step 4: Create a New Database

Inside the **Database** section:

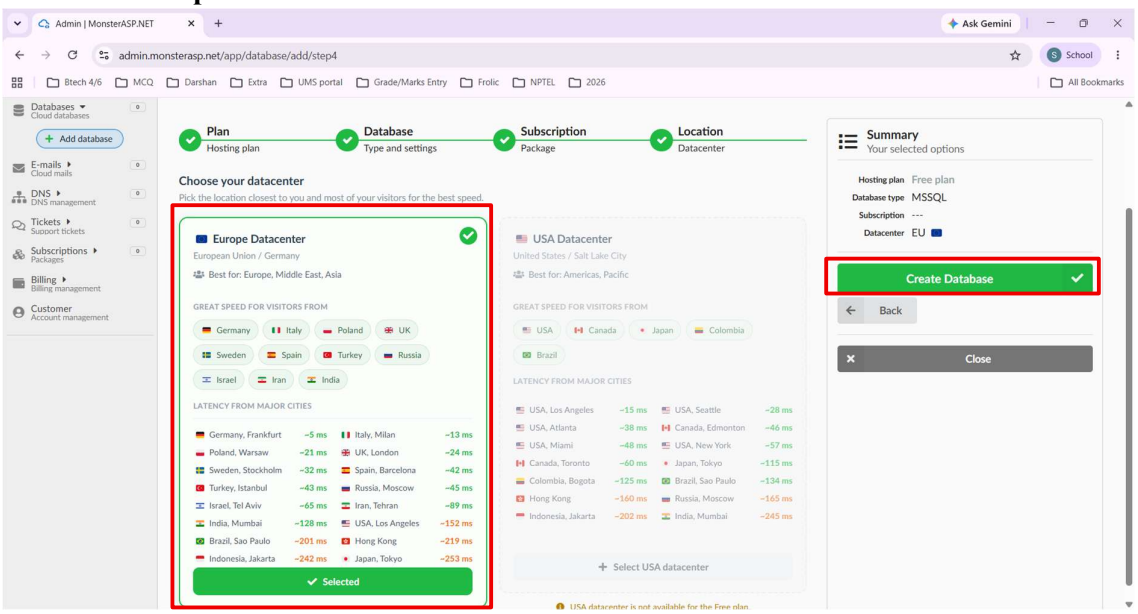

1. Click **Create**.

2. Select **Free Database**.

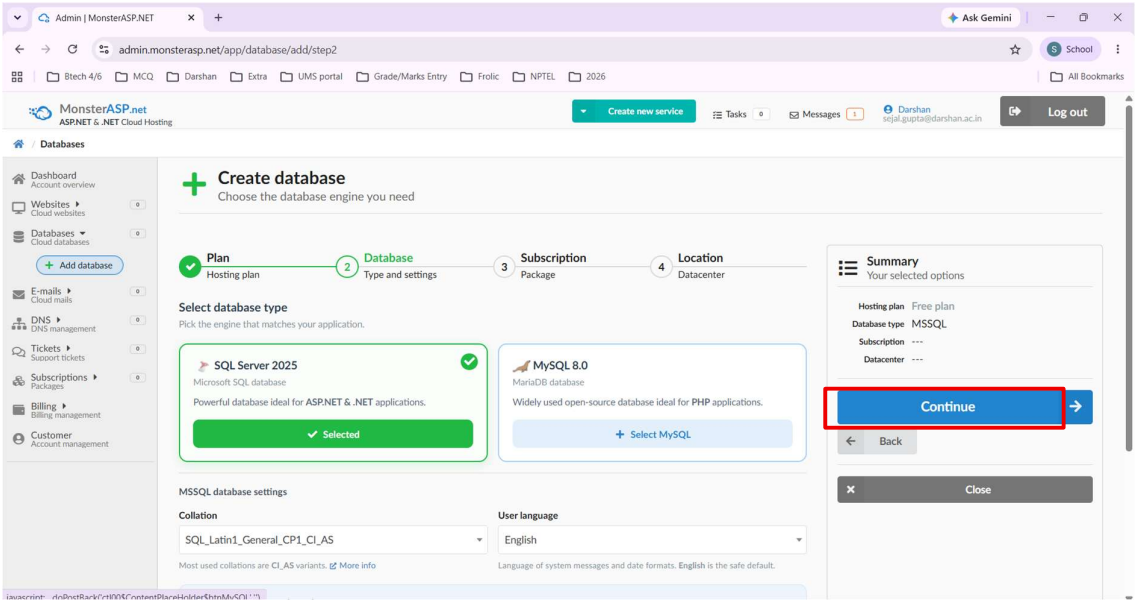

3. Select the **Europe** datacenter.

4. Click **Create Database**.

5. Continue with the setup.

Step 5: Check Your Email

After creating the database, MonsterASP.NET will provide the database information.

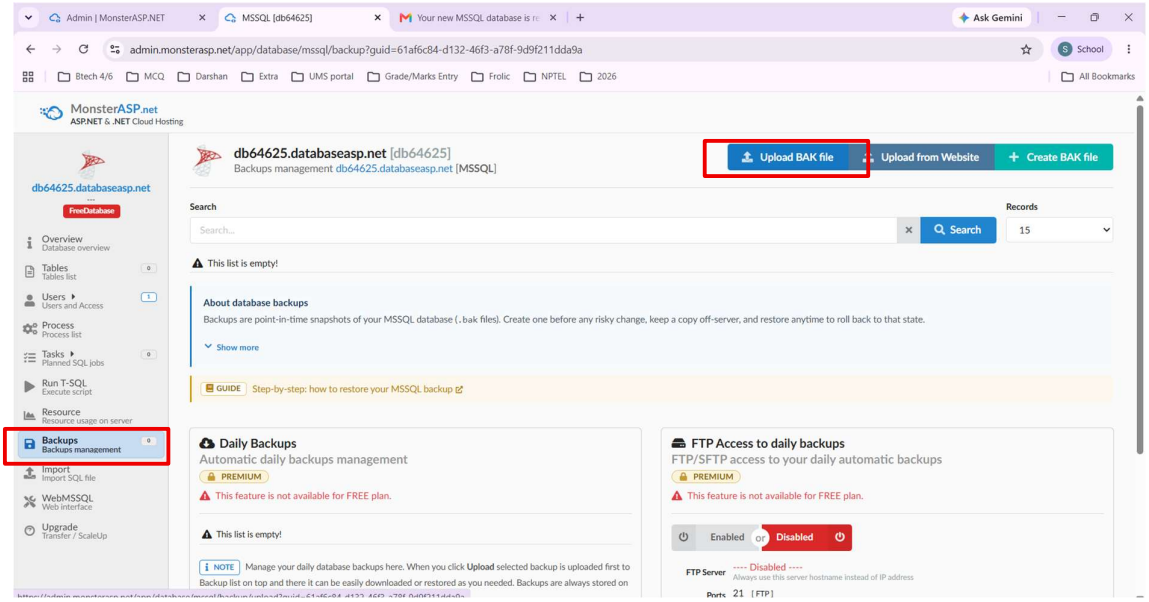

Check the email associated with your MonsterASP.NET account for the database details.

Keep this information safe because you will need it to connect to the database.

Step 6: Upload the `.bak` File

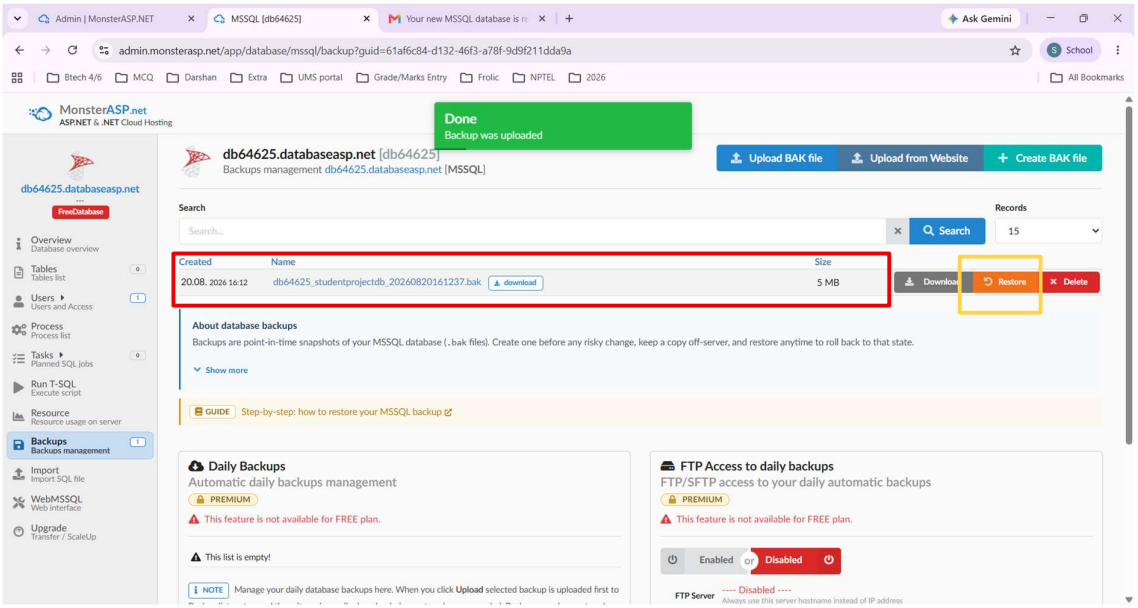

Now go back to the MonsterASP.NET admin panel.

1. Open your newly created database.

2. Find the **Backup** option in the sidebar.

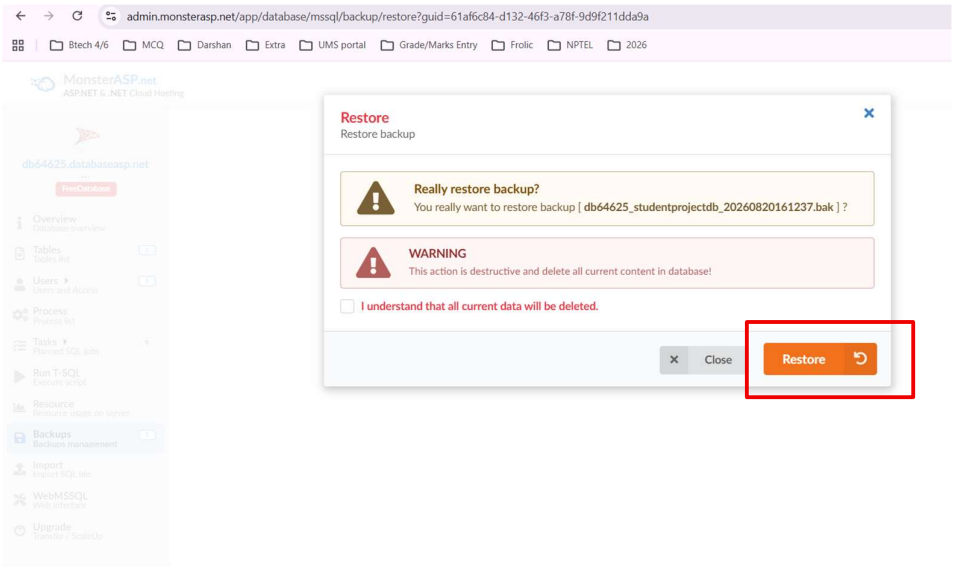

3. Click **Upload**.
4. Select the `.bak` file that you created in Step 1.
5. Wait for the upload to complete.

Step 7: Restore the Database

After the `.bak` file has been uploaded:

1. Select the uploaded backup.
2. Click **Restore**.

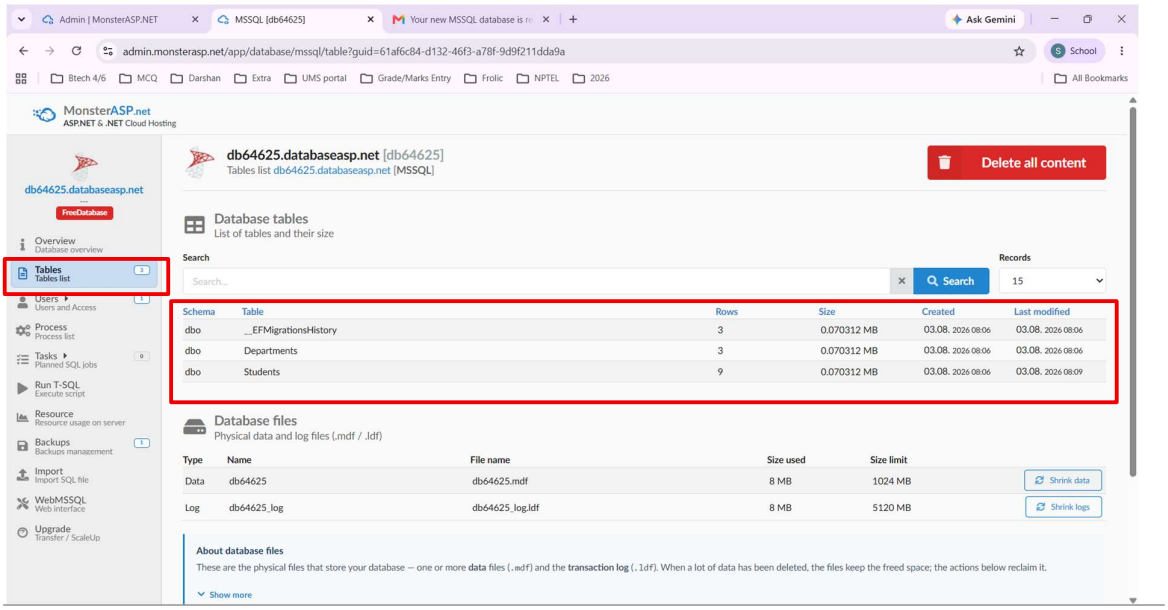

3. Wait for the restore process to finish.

MonsterASP.NET will restore the database from your `.bak` file.

This will automatically create your database objects, such as:

- Tables

- Data
- Views
- Stored Procedures
- Other supported database objects

Step 8: Verify That the Database Was Restored

After restoration is completed, verify that your database contains your tables and data.

You can check this by connecting to the hosted database through **SQL Server Management Studio (SSMS)**.

Step 9: Get Remote Access Details

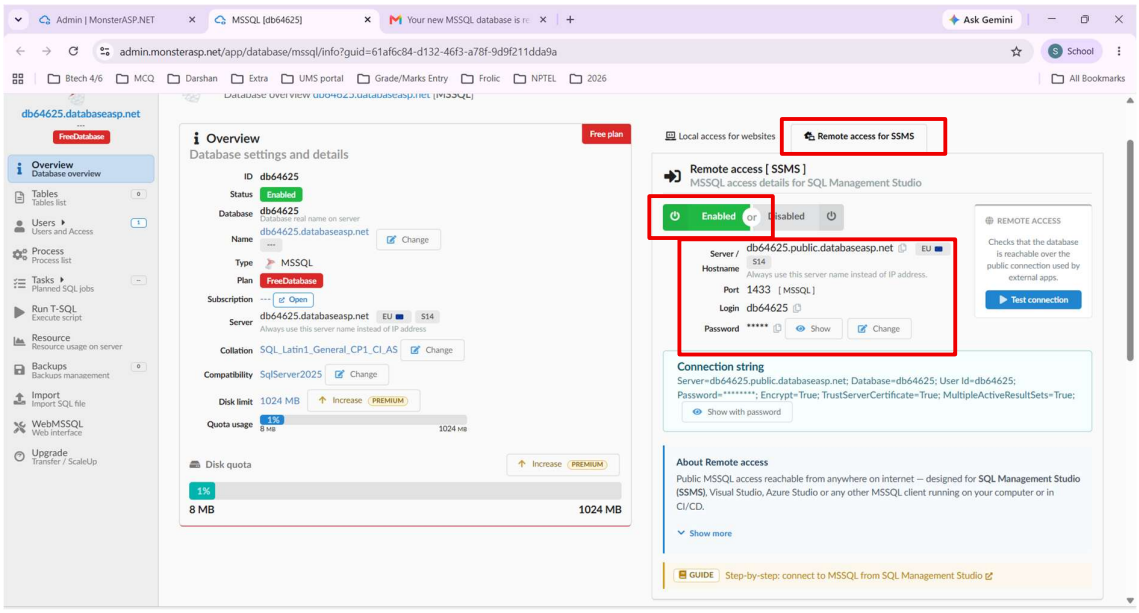

In MonsterASP.NET:

1. Go to **Overview** from the sidebar.
2. Find **Remote Access for SSMS**.
3. You will see the information required to connect to your hosted SQL Server database.

You may need details such as:

```
Server
Database
Username
Password
Port
```

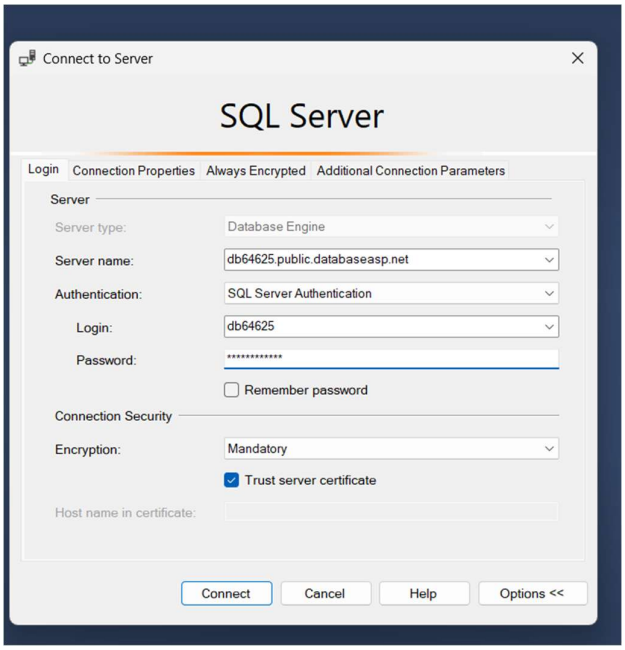

Keep these details available.

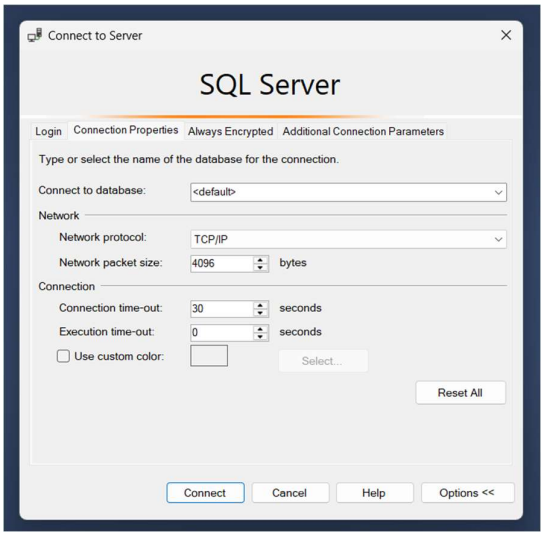

Step 10: Connect the Hosted Database Using SSMS

Open **SQL Server Management Studio**.

1. Click **Connect**.
2. Select **Database Engine**.
3. Enter the server information provided by MonsterASP.NET.

4. Enter your username and password.
5. Before connecting, click **Options >>**.
6. Open the **Connection Properties** tab.

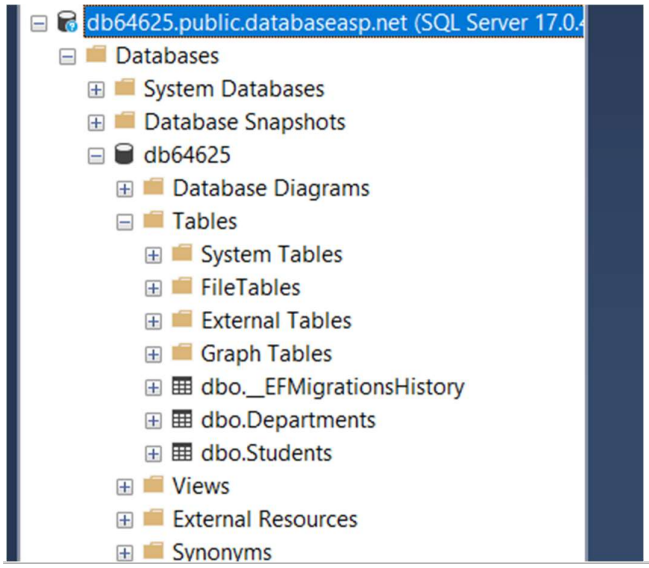

7. Make sure the required connection/network settings are configured as provided by MonsterASP.NET.
8. Click **Connect**.

Step 11: Verify the Hosted Database in SSMS

After successfully connecting:

1. Expand **Databases**.
2. Find your MonsterASP.NET database.
3. Expand the database.
4. Open **Tables**.
5. Verify that your tables are available.
6. Check some tables to confirm that your data has also been restored.

Step 12: Update Your ASP.NET Core Connection String

Now update the connection string in your ASP.NET Core application's `appsettings.json`.

Use the connection details provided by MonsterASP.NET.

Example:

```
{
  "Logging": {
    "LogLevel": {
      "Default": "Information",
      "Microsoft.AspNetCore": "Warning"
    }
  },
  "AllowedHosts": "*",

  "ConnectionStrings": {
    "Default": "Server=db64625.public.databaseasp.net,1433;Database=db64625;User
Id=db64625;Password=YOUR_PASSWORD;Encrypt=False;MultipleActiveResultSets=True;"
  }
}
```

Important: Replace the server, database, username, and password with the values from **your MonsterASP.NET database**.

Step 13: Test Your ASP.NET Core API

Now run your ASP.NET Core Web API.

You can test your API using:

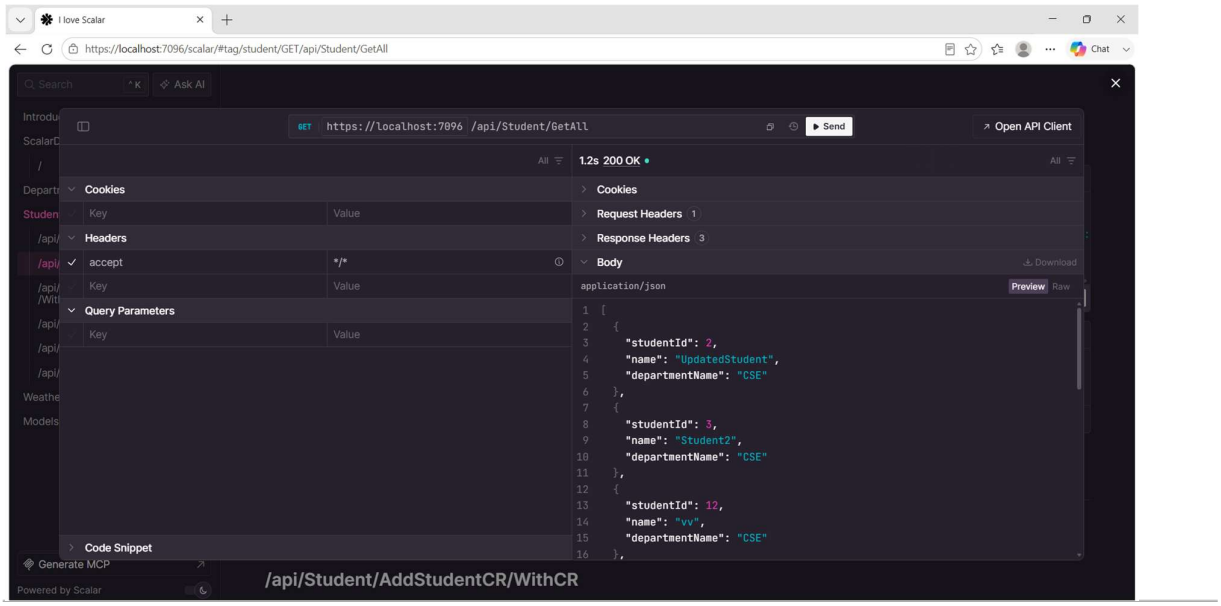

For example:

```
GET /api/Student
```

Check whether the API can successfully:

- Connect to the database
- Read data
- Insert data
- Update data

- Delete data

Step 14: Final Verification

If your API is working correctly and the data is coming from the MonsterASP.NET database, your database deployment is complete.

Final Flow

```
Local SQL Server
        ↓
Create .bak Backup
        ↓
MonsterASP.NET
        ↓
Create Database
        ↓
Upload .bak
        ↓
Restore Database
        ↓
Verify Database using SSMS
        ↓
Update appsettings.json
        ↓
Run ASP.NET Core API
        ↓
Test API
        ↓
Database Successfully Hosted
```
